3. Problem Statement: Customer Query Urgency Classification

A customer support company receives thousands of queries daily. To prioritize customer requests, the company wants an AI system that identifies the urgency level of each query.

Your task is to design an effective prompt that analyzes a customer query and classifies its urgency.

Input: A customer query in natural language.

Output: A single word representing the urgency level.

Allowed Outputs:

- High
- Medium
- Low

Examples:

Input Query	**Expected Output**
My bank account has been hacked, and money is being stolen.	High
My internet has been down for the entire day, affecting my work.	High
I haven't received my refund for the last seven days.	Medium
Can you tell me how to update my profile picture?	Low
I need to change my delivery address for an order arriving tomorrow.	Medium
I would like to know about your available subscription plans.	Low
I lost access to my account and cannot complete an urgent payment.	High

Constraint: The output must contain exactly one word: High, Medium, or Low. No explanations, punctuation, or additional text are allowed.
