2. Problem Statement: Sentiment Analysis

An online shopping company wants to analyze customer reviews automatically to understand customer satisfaction. Your task is to design a prompt that identifies the sentiment expressed in a customer review.

Classify each review into one of three categories based on the customer's overall sentiment.

Input: A customer review in natural language.

Output: A single word representing the sentiment.

Allowed Outputs:

- Positive
- Negative
- Neutral

Examples:

Input Review	**Expected Output**
The product is excellent, and I love its quality.	Positive
The delivery was late, and the product was damaged.	Negative
The product arrived yesterday.	Neutral
The customer support team was extremely helpful.	Positive
The product is not worth the money.	Negative
The package contained two items.	Neutral
The phone is good, but the battery life is terrible.	Negative

Constraint: The output must contain exactly one word: Positive, Negative, or Neutral. Do not provide explanations or additional text.
